SCORE OVER LENGTH SEARCHES

Attached is a score over length search. This search was developed to overcome limitations in most standard search systems which favor large sequences with high scoring, but lesser overall identity over smaller sequences with higher overall identity. This search is especially useful for relatively small nucleic acid or polypeptide target sequences (antisense, fragments, probes, primers, RNAi, epitopes, haptens, etc.) claimed functionally via a form of hybridization and/or identity language and having defined upper and lower polynucleotide and or polypeptide length limits.

The score over length search is performed by first running the query sequence using examiner-specified identity and polynucleotide or protein length limit parameters, and saving 65,000 hits and 0 alignments from each desired database. The resulting output is reformatted using a Microsoft Word macro and is imported into Excel. The summary table data are then sorted by the ratio of score of each hit sequence divided by its length and the accession numbers for all hits below the examiner's desired score over length parameters are deleted. The remaining accession numbers are used to pull the corresponding sequences from the databases into subdatabases enriched for good hits and the query sequence is re-run against these subdatabases to yield the final results.

The score	over	length	cutoff	for	this	search	is

Subject:

Sequence search request...

Hi Paul,

I have another request for a score over length search:

I need a length limited nucleotide sequence search of SEQ ID NO:2 in USSN 09661658, where the returns are rank ordered based on the score over length/ratio as we've discussed. I need the lengths limited to hits between 8 and 100 nucleotides, and I'll take as many hits as you can import into excel (64,000?), and alignments for anything above .75 on the above ratio. Hope this is clear, please call me if it's not. I also need the interference databases searched.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence represents the GpThlP6.131 aptamer construct used in the Ci invention. The invention relates to a novel aptazyme construct comprising a regulatable Group I intron aptamer oligonucleotide sequence having an CC allosterically regulatable regulatory domain, where the kinetic parameters of the aptazyme on a target gene vary in response to the interaction of an allosteric effector molecule with the regulatory cC domain, and the intron splicing reaction occurs in vitro. The aptazyme is CC useful: (1) in assays to detect the presence of ligands or to detect activation of an aptazyme by an effector; (2) in the identification, CC isolation and enhancement of allosteric effectors and of the CC allosterically regulatable aptazymes with which they interact; (3) to activate or repress a reporter gene (e.g. luciferase) containing an CC engineered intron in response to an endogenous activator; and (4) to consistor intracellular levels of proteins or small molecules such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

```

Novel regulatable, catalytically active nucleic acid comprising effector domain, and catalyst domain which comprises randomized catalytic residues and is regulated by effector that interacts with effector domain.

```

                                                                                                                                                          δ
                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                 The invention relates to a regulatable, catalytically active nucleic acid (RANA) segment comprising an effector domain and a nucleic acid catalyst comain in which one or more critical catalytic residues of the nucleic acid catalyst the catalytic domain in which one or more critical catalytic residues of the nucleic acid catalytic domain are regulated by an effector that interacts with the catalytic domain are regulated by an effector that interacts with the effector domain. Also included are a nucleic acid pool those uncleic acid to catalytic domain of a catalytical state an effector domain involving randomising at least one nucleic acids that interact with the catalytic target of the catalytic committed within the gene (where the presence of an effector causes uncleic acids that interact with the catalytic target of the catalytic committed within the gene (an effector domain), detection of a target using a RCANA capet of the catalytic condain, detection of a target using a RCANA, and detecting an RCANA (involving providing an RCANA, and detecting an RCANA (involving providing an RCANA, and detecting an RCANA (involving providing an RCANA, and detecting an RCANA (involving broating an RCANA). The product is catalytic activity, selecting an RCANA, and detecting an RCANA (involving broating an RCANA), and detecting an RCANA (involving broating an RCANA). The apporter cause a RCANA pepcific activity, selecting an RCANA, and detecting an RCANA (involving broating the product or regulate the expression of a product in a cell (by gene therapy) which involves inserting production of a product in a cell (by gene therapy) which involves inserting into a gene that cell an RCANA which comprises a catalytic domain, that modifies the product of the product of

Ct catalytic domain), detection of a target using a RCANA (involving providing a RCANA (involving providing a RCANA conditions that coarselved modification and modifying the target using a RCANA and electing an RCANA, espable of target appears a RCANA (involving isolating and modifying the target under conditions that CC cause a RCANA-specific activity), selecting an RCANA and detecting an RCANA (involving isolating an RCANA, creating an RCANA and detecting an RCANA, creating an RCANA and detecting an RCANA (involving isolating an RCANA, creating a construct in which the CC catalytic activity of the number or regulate the expression of a reporter CC in a cell (by gene therapy) which involves inserting into a gene that CC produces the product or regulates the production of the product or regulates the production of the product or regulates the production of the product or that alters the function of the catalytic domain, CC contacting the regulatory domain with an effector thereby regulating CC production of the product. The concentration of the effector modilates CC product is fully inhibited according to the concentration of the effector modilates CC product is product; where it accesses feedback inhibitor of the catalytic of metabolic pathway. The effector or the product is endogenous or exogenous to the cell. CC metabolic pathway. The effector or the product is an intermediate in a metabolic pathway. The effector or the product is an intermediate in a metabolic pathway that is being creating drugs, and immunosuppressants. The RCANA is useful for cepllating a hological pathway in a cell, for screening apopulation of cells in a metabolic pathway and immunosuppressants. The RCANA is useful for cells for a cell that produces a bioproduct, for modilating expression of call internal pathway in a cell, for screening a population of cells industrial biosynthesis and bioremediation. The present sequence is an constraint of the spirate of the spiration of the spiration of the produce is an observable of the spiration

The sequence represents a portion of the P6 region of the Group I ribozyme joined to the anti-theophylline aptamer by a short randomised region to generate a pool of aptazymes of the presents invention. The invention relates to a novel aptazyme construct comprising a regulatable group I intron aptamer oligonucleotide sequence having an allosterically regulatable regulatory domain, where the kinetic parameters of the aptazyme on a target gene vary in response to the interaction of an allosteric effector molecule with the regulatory domain, and the intron
                                                                                                                                                                                             Ellington AD, He
                                                                                                                               Aptazyme construct for detecting the presence of ligands, comprises regulatable Group I intron aptamer oligonucleotide with a regulatory domain, and modulates their kinetic parameters in response to an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 splicing reaction occurs in vitro. The aptazyme is useful: (1) in assays to detect the presence of ligands or to detect activation of an aptazyme by an effector; (2) in the identification, isolation and enhancement of allosteric effectors and of the allosterically regulatable aptazymes with which they interact; (3) to activate or repress a reporter gene (e.g. luciferase) containing an engineered intron in response to an endogenous activator; and (4) to monitor intracellular levels of proteins or small
                                                                                    The present invention relates to regulatable, catalytically active nucleic acids (RCANAs) which are regulated by polypeptides. These are useful for regulating gene expression, in assays for detecting the presence of ligands, for activation of an effector of RCANA, and in gene therapy. The present sequence is an oligonucleotide used in the construction of an RCANA
                                                                                                                                                                                                                            New regulatable, catalytically active nucleic acids (RCANA), useful in gene therapy (particularly for regulating gene expression), or in assays for detecting the presence of ligands or activation of an effector of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         당, 성
                                                                     The present invention describes a method for regulating production of a product in a cell. The method comprises inserting a regulatable cotatalytically active nucleic acid (RCANA) into a gene that produces the product or regulates the production of the product in the cell, where the coding potential and a regulatory domain that recognises an effector that alters the function of the catalytic domain, and contacting the cregulatory domain with an effector to regulate production of the product. CC Also described: (1) regulating a biological pathway in cell, or cregulating a population of cells for a cell that produces a bioproduct. CC The methods are useful for regulating a biological pathway in cell, or regulating production of a product in a cell. The RCANAs are useful as cregulating a biological pathway in cell, or cregulating production of a product in a cell. The RCANAs are useful as cregulating a biological pathway in cell, or regulating production of a product in a cell. The RCANAs are useful as cregulating a biological pathway in cell, or cregulating production of a product in a cell. The RCANAs are useful as cregulating or disfavouring production of genes in a metabolic control the expression of genes in a metabolic control the expression of genes in a metabolic control the expression of genes in a metabolic control the control the expression of a targeted bioproduct. CC The RCANAs are also useful for in vitro or in vivo sensing or detection, cand in gene therapy. The present sequence represents an oligonucleotide cused in the construction of an RCANA, which is used in an example from the construction of an RCANA, which is used in an example from the construction of an RCANA, which is used in an example from the construction of an RCANA, which is used in an example from the construction of an RCANA, which is used in an example from the construction of the construction of an RCANA, which is used in an example from the construction of the construction of an RCANA, which is used in the construction of the co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Regulating production of a product in a cell, comprises inserting a regulatable catalytically active nucleic acid into a gene that produces the product or regulates the production of the product in the cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ADA39564 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 2003-354657/33.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
The invention relates to a regulatable, catalytically active nucleic acid (RCANA) segment comprising an effector domain and a nucleic acid catalyst domain in which one or more critical catalytic residues of the nucleic acid catalytic have been randomised, where the kinetic parameters of the catalytic domain are regulated by an effector that interacts with the effector domain. Also included are a nucleic acid comprising a gene, a RCANA inserted within the gene (where the presence of an effector causes the nucleic acid to catalyse a reaction), isolating an RCANA (comprising a catalytic and an effector domain involving randomising at least one nucleotide in the catalytic domain of a catalytically active nucleic acid to create a nucleic acid gool, removing from the nucleic acid gool those nucleic acids that interact with the catalytic target of the catalytic
                                                                                                                                                                                                                                                                                                                                                              Example 5;
                                                                                                                                                                                                                                                                                                                                                                                                           Novel regulatable, catalytically active nucleic acid comprising effector domain, and catalyst domain which comprises randomized catalytic residues and is regulated by effector that interacts with effector domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 2004-560517/54.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              15-JUN-2000; 2000US-0212097P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC contacting the regulatory domain with an effector thereby regulating the activity of the product. The concentration of the effector modulates CC the activity of the catalytic domain of the RCANA. The production of the product is fully inhibited or is increased compared to a normal control CC level, or is partially inhibited according to the concentration of the CC effector. The RCANA blocks or activates expression of the gene. The conduct is product, where it accesses feedback inhibitor of the CC gene. The product is produced in a metabolic pathway that is being CC regulated, and the effector or the product is an intermediate in a CC metabolic pathway. The effector or the product is not product is endogenous or exogenous to the cell. CC the product is chosen from protein, enzyme, protein pharmaceutical, CC metabolite, drug, dye, vitamin, food additive, chemical additive, consent from antibiotics, anticancer drugs, and a waste product. The drug is CC lowering drugs, and immunosuppressants. The RCANA is useful for cells for a cell that produces a bioproduct, for modulating expression of coligonucleotide used to mutate the catalytic region of an RCANA based on the bacteriophage T4 thymidylate synthase gene self-splicing intron.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

These is useful for regulating gene expression, in assays for detecting the presence of ligands, for activation of an effector of RCANA, and in therapy. The present sequence is an RCANA described in the

Novel regulatable, catalytically active nucleic acid comprising effector domain, and catalyst domain which comprises randomized catalytic residues and is regulated by effector that interacts with effector domain.

Example 5; SEQ ID NO 64; 78pp; English.

The invention relates to a regulatable, catalytically active nucleic acid CC (CRANA) segment comprising an effector domain and a nucleic acid catalyst compain in which one or more critical catalytic residues of the nucleic catalytic domain are regulated by an effector that interacts with the CC catalytic domain are regulated by an effector that interacts with the CC catalytic domain are regulated by an effector that interacts with the CC catalytic domain are regulated are a nucleic acid comprising a gene, a CC knaw inserted within the gene (where the presence of an effector causes the nucleic acid to catalyse a reaction), isolating an RCANA (comprising CC the nucleic acid an effector domain involving randomising at least one concleic acids that interact with the catalytic target of the catalytic domain adding an effector molecule to the nucleic acid gool those nucleic acids that interact with the catalytic target of the catalytic target using a RCANA (involving providing a RCANA, capable of the catalytic domain), detection of a target using a RCANA, and detection of a target using a RCANA, capable of target catalytic activity of the nucleic acid as in position to regulate the expression of a reporter catalytic activity of the nucleic acid modifying the target under conditions that catalytic activity of the nucleic acid use a catalytic domain, that modifies a confaction of the product or regulates the expression of a product catalytic activity of the nucleic acid upon exposure of the host cell to catalytic activity of the nucleic acid upon exposure of the host cell to confacting the regulatory domain with an effector thereby regulating confacting the regulatory domain with an effector thereby regulating the catalytic domain, which comprises a catalytic domain, that modifies a chalytic domain, which comprises a catalytic domain, that modifies a chalytic domain with an effector thereby regulating the confactivity of the catalytic domain of the RCANA. The product in the catalytic domain with a compact to a normal c

The product where it accesses feedback inhibitor of the CC gene. The product is produced in a metabolic pathway that is being CC regulated, and the effector or the product is an intermediate in a CC metabolic pathway. The effector is endogenous or exogenous to the cell. CC The effector is an end product of a biosynthetic process. The effector or CC the product is chosen from protein, enzyme, protein pharmaceutical, CC metabolite, drug, dye, vitamin, food additive, chemical additive, CC pesticide, insecticide, feed compound, and a waste product. The drug is C chosen from antibiotics, anticancer drugs, antifungals, cholesterol-CC lowering drugs, and immunosuppressants. The RCANA is useful for C regulating a biological pathway in a cell, for screening a population of C anucleic acid, in gene therapy applications, and for facilitating conductival biosynthesis and biogramediation. The present sequence is an CRANA based on the bacteriophage T4 thymidylate eventuals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                      This invention describes a novel test system for detecting a splice reaction comprising at least 1 optionally similar immobilized nucleic acid with at least 1 nucleic acid (I) capable of splicing, at least 1 free detection system, at least a composition containing a splice component, a suitable detection probe, and if necessary other means of help. The method is used to identify substances, which are effective as fungicides, herbicides, pesticides and/or insecticides. The method can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RNA aptamer; splice reaction; detection; fungicide; herbicide; cancer; pesticide; insecticide; diagnosis; viral disease; Grave's disease; spinal muscular atrophy; beta-thalassemia; ds.

```

The sequences given in AAQ89181-88 represent nucleic acid ligands to theophylline. These ligands were identified using the method of the invention. The method comprises contacting a candidate mixture with the target molecule (i.e. theophylline) where the nucleic acids which have a increased affinity to the target relative to the candidate mixture can k partitioned from the remainder of the candidate mixture. The increased

acids

The isolated ligands may be used as pharmaceuticals, diagnostic agents and in gene therapy. The ligands may be RNA or DNA molecules. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                The present sequence is that of a short RNA aptamer which is inserted into the 5' untranslated region of the Epo gene in the pVETIMEpo vector. This aptamer is designed to bind specifically and with high affinity to theophylline, a soluble, cell permeable, non toxic ligand, and will result in the translational control of Epo protein expression being specifically induced and regulated following ligand treatment and binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RNA aptamer; inserted; Epo gene; pVETIMEpo vector; bind specifically;

                                             This sequence respresents a nucleic acid ligand to theophylline. This construct from the conserved domains of larger theophylline ligands and a limited flanking sequence. These ligands were identified cusing the method of the invention. The method comprises contacting a candidate mixture with the target molecule (i.e. theophylline) where the nucleic acids which have an increased affinity to the target relative to the candidate mixture can be partitioned from the remainder of the candidate mixture. The increased affinity nucleic acids are partitioned from the remainder of the candidate mixture and the isolated nucleic acids are amplified to yield a ligand-enriched mixture of nucleic acids, in which the nucleic acid ligands can be identified. The isolated ligands may be used as pharmaceuticals, diagnostic agents and in gene therapy. The ligands may be RNA or DNA molecules. (Updated on 25-MAR-2003 to

The sequences given in AAQ89117-29 represent nucleic acid ligands to theophylline. These ligands were identified using the method of the invention. The method comprises contacting a candidate mixture with the target molecule (i.e. theophylline) where the nucleic acids which have a nicreased affinity to the target relative to the candidate mixture can b partitioned from the remainder of the candidate mixture. The increased affinity nucleic acids are partitioned from the remainder of the candidate mixture and the isolated nucleic acids are amplified to yield ligand-enriched mixture of nucleic acids, in which the nucleic acid ligands can be identified. The isolated ligands may be used as pharmaceuticals, diagnostic agents and in gene therapy. The ligands may be RNA or DNA molecules. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to regulatable, catalytically active nucleic acids (RCANAs) which are regulated by polypeptides. These are useful for regulating gene expression, in assays for detecting the presence of ligands, for activation of an effector of RCANA, and in gene presence of presence of ligands activation of an effector of RCANA, and in gene presence of present sequence is a PCR primer used in the construction of the present sequence is a PCR primer used in the construction of the present sequence is a PCR primer used in the construction of the present sequence is a PCR primer used in the construction of the present sequence is a PCR primer used in the construction of the present sequence is a PCR primer used in the construction of the present sequence is a PCR primer used in the construction of the present sequence is a PCR primer used in the construction of the present sequence is a PCR primer used in the construction of the present sequence is a PCR primer used in the construction of the present sequence is a PCR primer used in the construction of the present sequence is a PCR primer used in the construction of the present sequence is a PCR primer used in the construction of the present sequence is a PCR primer used in the construction of the present sequence is a PCR primer used in the construction of the present sequence is a PCR primer used in the present sequence is a PCR primer used in the present sequence is a PCR primer used in the present sequence is a PCR primer used in the present sequence is a PCR primer used in the present sequence is a PCR primer used in the present sequence is a PCR primer used in the present sequence is a PCR primer used in the primer used in the primer used in the primer used in the present sequence is a PCR primer used in the primer used 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 24
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a method for regulating production of a cproduct in a cell. The method comprises inserting a regulatable catalytically active nucleic acid (RCANA) into a gene that produces the product or regulates the production of the product in the cell, where the catalytic domain which modifies a transcript to alter the function of the catalytic domain that recognises an effector that alters the function of the catalytic domain, and contacting the regulatory domain with an effector to regulate production of the product. Also described: (1) regulating a biological pathway in cell; and (2) coreening a population of cells for a cell that produces a bioproduct. The methods are useful for regulating a biological pathway in cell, or regulatory elements to control the expression of genes in a metabolic pathway, or as regulated selectable markers to increase a selective pathway, or as regulated selectable markers to increase a metabolic pathway, or as regulated selectable markers to increase a selective pathway, or as regulated selectable markers to increase a selective pathway, or as regulated selectable markers to increase a selective pathway, or as regulated selectable markers to increase a selective pathway. The present sequence represents an oligonucleotide used in the construction of an RCANA, which is used in an example from the construction of an RCANA, which is used in an example from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

Novel regulatable, catalytically active nucleic acid comprising effector domain, and catalyst domain which comprises randomized catalytic residues regulated by effector that interacts with effector domain.

Example 5; SEQ ID NO 18; 78pp; English.

CRCANA) segment comprising an effector domain and a nucleic acid comain in which one or more critical catalytic residues of the nucleic catalyte thave been randomised, where the kinetic parameters of the Catalytic domain are regulated by an effector that interacts with the Catalytic domain are regulated by an effector that interacts with the Catalytic domain. Also included are a nucleic acid comprising a gene, a CC RCANA inserted within the gene (where the presence of an effector causes the nucleic acid to catalyte a reaction), isolating an RCANA (comprising CC a catalytic and an effector domain involving randomising at least one conclude catalytic and an effector domain of a catalytically active nucleic acid to create a nucleic acid gool, removing from the nucleic acid gool those nucleic acids that interact with the catalytic target of the catalytic domain, adding an effector molecule to the nucleic acids and isolating CC those nucleic acids that interact with the catalytic target of the catalytic domain), detection of a target using a RCANA, modifying a CC target using a RCANA, (involving isolating providing a RCANA, modifying a CC target using a RCANA, pepcific activity), selecting an RCANA, and detecting an RCANA, (involving isolating an RCANA, creating a construct in which the catalytic activity of the nucleic acid used and detecting an RCANA, introducing the construct into a host cell and measuring the catalytic acid used and measuring the construct in which the catalytic activity of the nucleic acid used production of a product in a cell (by gene therapy) which involves inserting into a gene that constructing the regulatory domain, that modifies a transcript to alter its coding potential, and a regulatory domain which constructing the catalytic domain, that modifies a transcript to alter its coding potential, and a regulatory domain which construct in the catalytic domain, that modifies a transcript of the regulating the consentration of the catalytic domain, and in the catalytic domain, and a regulating

effector. The RCANA blocks or activates expression of the effector is the product, where it accesses feedback inhibi

where it accesses feedback inhibitor

gene. ..

The product is produced in a metabolic pathway that is being regulated, and the effector or the product is an intermediate in a metabolic pathway. The effector is endogenous or exogenous to the cell. The effector is an end product of a biosynthetic process. The effector or the product is chosen from protein, enzyme, protein pharmaceutical, metabolite, drug, dye, vitamin, food additive, chemical additive, pesticide, insecticide, feed compound, and a waste product. The drug is chosen from antibiotics, anticancer drugs, antifungals, cholesterollowering drugs, and immunosuppressants. The RCANA is useful for regulating a biological pathway in a cell that produces a bioproduct, for modulating expression of a nucleic acid, in gene therapy applications, and for facilitating industrial biosynthesis and biogramediation. The present sequence is a PCR reference

Novel regulatable, catalytically active nucleic acid comprising effector domain, and catalyst domain which comprises randomized catalytic residues and is regulated by effector that interacts with effector domain.

Example 1; SEQ ID NO 3; 78pp; English

CC catalytic domain are regulated by an effector that interacts with the ceffector domain. Also included are a nucleic acid comprising a gene, a CC RCANA inserted within the gene (where the presence of an effector causes C the nucleic acid to catalyte and an effector domain are included are a nucleic acid comprising a gene, a CC RCANA inserted within the gene (where the presence of an effector causes C the nucleic acid to catalyte a reaction), isolating an RCANA (comprising CC anceletic acid by the catalytic domain involving randomising at least one nucleic acids that interact with the catalytic target of the catalytic domain, adding an effector molecule to the nucleic acid pool those nucleic acids that interact with the catalytic target of the catalytic domain, adding an effector molecule to the nucleic acid solating CC those nucleic acids that interact with the catalytic target of the specific modification and modifying the target under conditions that cause a RCANA, specific activity), selecting an RCANA and detecting an CC RCANA (involving isolating an RCANA, capable of target catalytic activity of the nucleic acid upon exposure of the host cell to C catalytic activity of the nucleic acid upon exposure of the host cell to recomprise the product or regulates the production of a product tin a cell (ly gene therapy) which involves inserting into a gene that C produces the product or regulates the function of the product in the C catalytic activity of the catalytic domain, that modifies a C transcript to alter its coding potential, and a regulatory domain which recomprises a catalytic domain, that modifies a C transcript to alter its coding potential, and a regulatory domain which recomprises and fector that alters the function of the catalytic domain, c effector is comprised to an another to a north administration of the catalytic domain. The catalytic domain with an effector to the catalytic domain of the seffector is partially inhibited according to the concentration of the effector is an intermediate in a c the product is chosen from protein, enzyme, protein pharmaceutical, metabolite, drug, dye, vitamin, food additive, chemical additive, pesticide, insecticide, feed compound, and a waste product. The drug is chosen from antibiotics, anticancer drugs, antifungals, cholesterollowering drugs, and immunosuppressants. The RCANA is useful for regulating a biological pathway in a cell, for screening a population of cells for a cell that produces a bioproduct, for modulating expression of a nucleic acid, in gene therapy applications, and for facilitating industrial biosynthesis and bioremediation. The present sequence is a PCR industrial biosynthesis and bioremediation. invention relates to a regulatable, catalyticall ANA) segment comprising an effector domain and a ain in which one or more critical catalytic resid ij the construction of an RCANA. catalytically active nucleic acid domain and a nucleic acid catalyst residues of the nucleic

                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                       The present invention describes a new isolated nucleic acid sequence (I) CC comprising a DPP10 mRNA sequence. DPP10 is a diseptidyl peptidase (also CC known as prolyloligopeptidase). (I) has antiinflammatory, antiasthmatic, CC antipsoriatic, antiarthritic and antirheumatic activities, and can be cused in vaccines and gene therapy. A composition comprising (I) can be CC used in vaccines and gene therapy. A composition comprising (I) can be CC or for preventing or treating inflammatory disease e.g., inflammatory CC bowel disease, asthma, atopy, rheumatoid arthritis or psoriasis. (I) can CC also be used in an assay for detecting or measuring DPP10 in a sample. A CC host cell comprising (I) can be used for producing recombinant DPP10 gene CC products, or in drug screening systems to identify agents for diagnosis CC or treatment of individuals having or susceptible to inflammatory CC disease. Human DPP10 is located on chromosome 2, more specifically CC chromosome 2q14. ABQ84254 to ABQ84612 and ABP55569 to ABP5629 represent CC sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                Query Match

The products of the invention are useful for screening an active ingredient for preventing and treating paroxysmal kinesigenic chorecathetosis or pathologies linked to dysfunction of transport of organic anion transported as cysteinyl leukotriene, anionic drugs, such as glutathione, glucuronate or sulphate conjugated to acidic ligands, such as glutathione, glucuronate or sulphate conjugated drugs and can be used for somatic gene therapy. This sequence represents a section of the product of the 
        Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           multidrug resistance-like subgroup; somatic gene therapy; ABCC12; paroxysmal kinesigenic choreoathetosis; cysteinyl leukotriene; anionic drug; methotrexate; neutral drug; glutathione; glucuronate;
                                                                             PCR primer; polymerase chain reaction; amplification; UM-STS; universal mammalian sequence tagged site; genomic map; clone;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a specifically claimed oligonucleotide PCR primer. The oligonucleotide can be used for polymerase chain reaction (PCR) amplification of DNA, specifically regions of specific genes that are conserved among mammalian species, i.e. pairs of oligonucleotides from the present specification represent universal mammalian sequence-tagged site (UM-STS) primers. The primers are used to develop genomic maps, to isolate clones from libraries, to make cross-species comparisons and to develop additional genetic markers. UM-STS allow genomic comparisons to be made between more species
                                                                                                                                                                       23-APR-2002; 2002WO-US013135

junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antialtergic, antiaethmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also of or enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing or depleting levels of, or reducing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of brigainone or lung surfactant in a subject's tissue, or treating bronchoconstriction. The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from MIPO at fig., wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel pharmaceutical composition, first active agent comprising an oligonucleotide antisense tinitiation codon, coding region, 5' or 3' end genomic flanki
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its responding RNAs, and glucocorticoid or non-glucocorticoid steroid or continuous con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 15;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Miller S,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ubiquinone

                                                                                                                                                                                                                                                                                                                                                                   Composition comprises oligo and is administered to reduce the production or cancer and can be anti-sense to the corresponding mRNA.

Combined invention also describes a kit, that comprises: (a) a delivery composition of the invention also describes a kit, that comprises: (b) a delivery composition for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenargic agonist. The composition is useful for preventing or composition comprises oligo and is administered to reduce the production composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition allergies and/or bronchoconstriction and/or lung ulmonary obstruction, allergies and/or bronchoconstriction and/or lung complementation, allergies, asthma, impeded respiration, respiratory hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary composition rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system content and effect, kidney, etc.

                                                                                                                                                                                     invention. The invention relates to a novel aptazyme construct comprising a regulatable group I intron aptamer oligonucleotide sequence having an allosterically regulatable regulatory domain, where the kinetic parameters of the aptazyme on a target gene vary in response to the interaction of an allosteric effector molecule with the regulatory domain, and the intron splicing reaction occurs in vitro. The aptazyme is useful: (1) in assays to detect the presence of ligands or to detect activation of an aptazyme by an effector; (2) in the identification, isolation and enhancement of allosteric effectors and of the allosterically regulatable aptazymes with which they interact; (3) to activate or repress a reporter gene (e.g. luciferase) containing an engineered intron in response to an endogenous activator; and (4) to monitor intracellular levels of proteins or small molecules such as cyclic AMP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ellington AD, ne.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              itself"
                                                                                                                                                                                                                                                                      ۲
```

The present invention relates to regulatable, catalytically active nucleic acids (RCANAs) which are regulated by polypeptides. These at useful for regulating gene expression, in assays for detecting the presence of ligands, for activation of an effector of RCANA, and in

are gene

The useful for regulating gene expression, in assays for detecting presence of ligands, for activation of an effector of RCANA, are therapy. The present sequence is an RCANA described in the
                                                                                                                                                                                                                                                                                                                                                                                  misc_binding
                                                                                                                                                                                                                                                                                                                                                                                                                                          misc_binding

Novel regulatable, catalytically active nucleic acid comprising effector domain, and catalyst domain which comprises randomized catalytic residues and is regulated by effector that interacts with effector domain.

Example 1; SEQ ID NO 38; 78pp; English.

The invention relates to a regulatable, catalytically active nucleic acid (RCANA) segment comprising an effector domain and a nucleic acid catalyst compain in which one or more critical catalytic residues of the nucleic catalytic domain are regulated by an effector that interacts with the catalytic domain. Also included are a nucleic acid comprising a gene, a complete acid to catalyse are detector. It is a nucleic acid comprising a gene, a catalytic acid to catalyte and an effector domain involving randomising at least one complete acid to create a nucleic acid pool, removing randomising at least one concleic acids that interact with the catalytic target of the catalytic domain of a catalytic target of the catalytic domain, adding an effector molecule to the nucleic acid pool those nucleic acids that interact with the catalytic target of the catalytic domain, adding an effector molecule to the nucleic acid shall include a removing from the nucleic acid pool those catalytic domain, adding an effector molecule to the nucleic acids and isolating catalytic complete acids that interact with the catalytic target of the specific modification and modifying the target using a RCANA, modifying a catalytic domain, detecting an account of a target of the specific modification and modifying the target under conditions that cause a RCANA-specific activity, selecting a RCANA and detecting an account of interactivity, of the nucleic acid upon exposure of the host cell to the effector. The RCANA is useful for regulating production of a product in the catalytic domain, which comprises a catalytic odmain, that modifies a transcript to alter its coding potential, and a regulatory domain which control is fully inhibited or is increased compared to a normal control the effector. The RCANA blocks or activates expression of the gene. The effector. The RCANA blocks or activates expression of the segme. The effector. The RCANA blocks or activates expression of the gene. The effector is the product, where it accesses feedback inhibitor of the gene. The product is produced in a metabolic pathway that is being regulated, and the effector or the product is an intermediate in a

The effector is endogenous or exogenous to the cell. The effector is an end product of a biosynthetic process. The effector or the product is chosen from protein, enzyme, protein pharmaceutical, metabolite, drug, dye, vitamin, food additive, chemical additive, pesticide, insecticide, feed compound, and a waste product. The drug is chosen from antibiotics, anticancer drugs, antifungals, cholesterollowering drugs, and immunosuppressants. The RCANA is useful for regulating a biological pathway in a cell, for screening a population of cells for a cell that produces a bioproduct, for modulating expression of a nucleic acid, in gene therapy applications, and for facilitating industrial biosynthesis and bioremediation. The present sequence is an RCANA based on the bacteriophage T4 thymidylate synthase gene self-

Novel regulatable, catalytically active nucleic acid comprising effector domain, and catalyst domain which comprises randomized catalytic residues and is regulated by effector that interacts with effector domain.

Sooter L; 8

Example 5; SEQ ID NO 65; 78pp; English.

CC catalytic domain are regulated by an effector that interacts with the Ceffector domain. Also included are a nucleic acid comprising a gene, a CC RCANA inserted within the gene (where the presence of an effector causes CC the nucleic acid to catalyse a reaction), isolating an RCANA (comprising a catalytic and an effector domain involving randomising at least one concluded in the catalytic domain involving randomising at least one concluded a cide that interact with the catalytic transpet of the catalytic commain adding an effector molecule to the nucleic acid pool those nucleic acids that interact with the catalytic target of the catalytic domain, adding an effector molecule to the nucleic acid and isolating CC those nucleic acids that interact with the catalytic target of the catalytic domain), detection of a target using a RCANA modifying a conclusion of a target using a RCANA, supported to a RCANA, involving providing a RCANA capable of target cause a RCANA-specific activity), selecting an RCANA and detecting an RCANA, introducing the construct into a host cell and measuring the catalytic activity of the nucleic acid upon exposure of the host cell to CC catalytic activity of the nucleic acid upon exposure of the host cell to CC catalytic activity of the nucleic acid upon exposure of the product in the CC catalytic domain, which comprises a catalytic domain, that modifies a product or regulator the function of the product in the CC contacting the regulatory domain with an effector thereby regulating production of the product to the the RCANA. The production of the product of the catalytic domain, that modifies a contacting the partially inhibited according to the concentration of the catalytic domain of the RCANA. The production of the effector. The RCANA blocks or activities expression of the gene. The cc effector is the product, where it accesses feedback inhibitor of the ceffector is the product is an intermediate in a metabolic pathway that is being contacting the effector is endogenous or exogenous to The invention relates to a regulatable, catalytically active nucleic ac (RCANA) segment comprising an effector domain and a nucleic acid cataly domain in which one or more critical catalytic residues of the nucleic acid catalyst have been randomised, where the kinetic parameters of the catalytically active nucleic acid of the

The present invention describes a method for determining the methylation status of CpG dinucleotides within the genes for oestrogen receptor, p21, p27, p16, progesterone receptor, myoglobin, pcna, cdc2, cerB2, p33 and/or CEA, which comprises contacting the target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides, and determining from the methylation status of the CpG positions the presence of a colon cancer. A set of oligomers or peptide nucleic acid (PNA)-oligomers can be used as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNP) of a corresponding genomic DNA by analysis of a chemically pretreated genomic DNA. The pretreated genomic DNA is useful for the determination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the product is chosen from protein, enzyme, protein pharmaceutical, metabolite, drug, dye, vitamin, food additive, chemical additive, pesticide, insecticide, feed compound, and a waste product. The drug is chosen from antibotics, anticancer drugs, antifungals, cholesterollowering drugs, and immunosuppressants. The RCANA is useful for regulating a biological pathway in a cell, for screening a population of rells for a cell that produces a bioproduct, for modulating expression of a nucleic acid, in gene therapy applications, and for facilitating industrial biosynthesis and bioremediation. The present sequence is an RCANA based on the bacteriophage T4 thymidylate synthase gene self-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Determining methylation status of CpG dinucleotides using modified genomic sequences, oligonucleotides and/or PNA-oligomers, useful in the characterization, grading, staging and/or diagnosis of colon cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ACF63061;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ACF63061 standard;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ន្តន្តន្តន្តន្ត
                                                   The present invention describes a method for determining the methylation estatus of CpG dinucleotides within the genes for oestrogen receptor, p21, CC p27, p16, progesterone receptor, myglobin, pcna, cdc2, c-erB2, p53 cC and/or CEA, which comprises contacting the target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides, and determining from the methylation status of the CpG positions the presence of a colon cancer. A set of oligomers or peptide nucleic acid (PNA)-oligomers can be used as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNP) cf a corresponding genomic DNA by analysis of a chemically pretreated genomic DNA. The pretreated genomic DNA is useful for the determination of the methylation status of a corresponding genomic DNA and/or detection of SNPs. The methods and pretreated genomic DNA are also useful for the characterisation, classification, diagnosis and differentiation of colon cell proliferative disorders. ACF62752 to ACF63278 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                          The invention relates to a novel method for detecting and differentiating between colon cell proliferative disorders associated with at least one gene or its regulatory regions. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least one reagent or a series of reagents, where the reagent or series of reagents, distinguishes between methylated and non methylated CpG dinucleotides within the target nucleic acid. The molecules of the invention demonstrate cytostatic activity whilst the method may useful for detecting and differentiating between colon cell proliferative disorders, including cancers such as colon adenoma and colon carcinoma. The PNA (peptide nucleic acid) -01igomers are useful as probes for determining cytosine methylation state or single nucleotide polymorphisms. The current sequence is that of the hybridisation
                                                                                                                                                                                                             Sequence 18

The useful for regulating gene expression, in assays for detecting presence of ligands, for activation of an effector of RCANA, an therapy. The present sequence is an oligonucleotide used in the construction of an RCANA

                                                                                                                                                                                                                                                                                                                                                                                                                                   S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        product in a cell. The method comprises inserting a regulatable catalytically active nucleic acid (RCANA) into a gene that produces the product or regulates the production of the product in the cell, where the RCANA comprises a catalytic domain which modifies a transcript to alter the coding potential and a regulatory domain that recognises an effector that alters the function of the catalytic domain, and contacting the regulatory domain with an effector to regulate production of the product. Also described: (1) regulating a biological pathway in cell, and (2) as creening a population of cells for a cell that produces a bioproduct. The methods are useful for regulating a biological pathway in cell, or regulating production of a product in a cell. The RCANAs are useful as regulatory elements to control the expression of genes in a metabolic pathway, or as regulated selectable markers to increase a selective the RCANAs are also useful for in vitro or in vivo sensing or detection, and in gene therapy. The present sequence represents an oligonuclectide used in the construction of an RCANA, which is used in an example from

Novel regulatable, catalytically active nucleic acid comprising effector domain, and catalyst domain which comprises randomized catalytic residue and is regulated by effector that interacts with effector domain.

Example 5; SEQ ID NO 20; 78pp; English.

The invention relates to a regulatable, catalytically active nucleic acid (RCANA) segment comprising an effector domain and a nucleic acid catalyst commain in which one or more critical catalytic residues of the nucleic catalytic domain are regulated by an effector that interacts with the effector domain. Also included are a nucleic acid comprising a gene, a RCANA inserted within the gene (where the kinetic parameters of the catalytic and an effector domain involving randomising at least one nucleic acid to catalyte a reaction), isolating an RCANA (comprising catid to create a nucleic acid comprising a gene, a catalytic and an effector domain involving randomising at least one nucleic acids that interact with the catalytically active nucleic acid comain, adding an effector molecule to the nucleic acids and isolating catalytic domain, adding an effector molecule to the nucleic acids and isolating catalytic domain), detection of a target uning a RCANA, modifying a respectific modification and modifying the target under conditions that cause a RCANA, specific activity, selecting an RCANA and detecting an regulating providing a RCANA, modifying a catalytic acid with the catalytic target of the catalytic acid with the catalytic under conditions that cause a RCANA, specific activity, selecting an RCANA, modifying a catalytic acid with the catalytic and measuring the catalytic acid upon exposure of the host catalytic acid is in posticion to regulate the expression of a reporter gene, introducing the construct into a host cell and measuring the catalytic acid upon exposure of the host cell to the effector. The RCANA is useful for regulating production of a product to a cell (by gene therapy) which involves inserting into a gene that recognises an effector that alters the function of the redatlytic domain, that modifies a catalytic domain with an effector the product in the catalytic domain, that modifies a catalytic domain with an effector the catalytic domain of the RCANA, The product on of the sense the product is pr the product is chosen from protein, enzyme, protein pharmaceutical, metabolite, drug, dye, vitamin, food additive, chemical additive, pesticide, insecticide, feed compound, and a waste product. The drug

The RCANA is useful for regulating a biological pathway in a cell, for screening a population of cells for a cell that produces a bioproduct, for modulating expression of a nucleic acid, in gene therapy applications, and for facilitating industrial biosynthesis and bioremediation. The present sequence is an oligonucleotide used to mutate the catalytic region of an RCANA based on the bacteriophage T4 thymidylate synthase gene self-splicing intron.

The group I intron aptamer oligonucleotide sequence having an allosterically regulatable regulatory domain, where the kinetic parameters of the aptazyme on a target gene vary in response to the interaction of an allosteric effector molecule with the regulatory domain, and the intron splicing reaction occurs in vitro. The aptazyme is useful: (1) in assays to detect the presence of ligands or to detect activation of an aptazyme by an effector; (2) in the identification, isolation and enhancement of allosteric effectors and of the allosterically regulatable aptazymes with which they interact; (3) to activate or represens a reporter gene (e.g. luciferase) containing an engineered intron in response to an endogenous activator; and (4) to monitor intracellular levels of proteins or small molecules such as cyclic AMP
